## (54) BRAKE SYSTEM OF SADDLE-STRADDLE FOUR-WHEEL VEHICLE

## (57)Abstract:

PROBLEM TO BE SOLVED: To provide a brake system for saddle-straddle four-wheel vehicle, which can simplify connecting structure of a brake pedal and a master cylinder without having a habitable space for a rider restricted by the brake pedal.

SOLUTION: In a brake system for a saddle-straddle four-wheel vehicle which has a master cylinder 24 driven by operating a brake pedal 23 for driving a brake device by oil pressure generated in the master cylinder 24, the brake pedal 23 and the master cylinder 24 are placed in front of one of steps on the right and the left which are mounted on a side of an engine 15, and on an inner lateral surface of the engine 15. Thereby, the brake pedal 23 will not restrict a habitable space for a rider since the brake pedal 23 is placed in front of one of steps on the right and the left which are mounted on a side of the engine 15, and on an inner lateral surface of the engine 15. In addition, as the brake pedal 23 and the master cylinder 24 are directly connected without having a linking mechanism or the like intervened between them, their connecting structure can be simplified.

## LEGAL STATUS

[Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]
